Potential CO2 savings/car/year***

88 to 151 kilos or 194 to 332 lbs.

Disclaimer:

SolarDrive takes no responsibility for the correctness of the basic data obtained from the National Aeronautics and Space Administration (NASA), nor for the actual experienced results. The figures above are presented as a guideline only. Actual results may be influenced by many other varying factors such as length of course, altitude, seasonal and present weather conditions, time of year and day, shading (e.g., from buildings, houses, trees, mountains) and regular or irregular maintenance routines of the batteries and golf car.

^{**}Source: NASA Langley Research Center Atmospheric Science Data Center (22 year average)

^{***}CO2 savings are calculated compared to grid electricity supplied from modern power plants burning fossil fuels (0.49-0.85 kg CO2/kWh)

^{****}If battery charge level is low from the start the S2E must be allowed the necessary time to charge as the energy is accumulated over the day
